SUPERPOWER Turning ambiguous product problems into secure, reliable systems from zero to production.

PROFILE

Product-minded back-end engineer and technical founder building software since 2017 and leading production delivery since 2020. Co-founded and exited Raposa, owning APIs and reliability for a first-party data platform processing 500,000+ events per day. Led 25+ client projects at WeDeveloped, including a real-time scheduling platform for 1,500 active users. Hands-on with TypeScript, Node.js, Python, Redis, PostgreSQL/Neon, GitHub Actions, secure delivery practices, and AI-assisted engineering.

500K+ TRACKING EVENTS / DAY	1,500 ACTIVE OAB USERS	25+ CLIENT PROJECTS	291 GITHUB CONTRIBUTIONS / 12 MO
---------------------------------------	----------------------------------	-------------------------------	--

CORE SKILLS

Back-end & Data: TypeScript, Node.js, JavaScript, Python, Java (working knowledge), high-throughput APIs, real-time pipelines, webhooks, async processing, PostgreSQL, Neon, Redis

Delivery & Reliability: GitHub Actions, CI/CD, Vercel, Docker, EC2, Azure managed databases, testing, security scanning, observability

AI & Product: Codex, Claude Code, LLM/agent architecture, RAG concepts, full-stack product delivery, React, Next.js

PROFESSIONAL EXPERIENCE

RAPOSA | Co-Founder & CEO/CTO

Dec 2024 - Aug 2026

Brazil - Hybrid | Founder exit completed Aug 2026

- Co-founded and exited a two-person ad-tech startup; owned API architecture and service availability for TracelQ, a first-party tracking and campaign data platform.
- Designed TypeScript APIs processing 500,000+ tracking events per day on average across clients, with p95/p99 latency and end-to-end availability monitoring.
- Introduced Redis caching to reduce Neon compute pressure; operated the data layer at approximately 100 CU-hours per week with average database spend of R\$750-R\$1,000 per month.
- Built a GitHub Actions delivery pipeline with linting, type checks, tests, dependency auditing, PR preview deployments, staging/production gates, concurrency cancellation, and failure notifications across Vercel and Neon.

WEDEVELOPED | Founder & Technical Lead

Dec 2020 - Present

Ribeirao Preto, SP | Independent software studio

- Founded a boutique software studio and delivered 25+ client projects, evolving from high-conversion web experiences to custom production systems in 2025.
- Lead 2-3 person delivery teams across discovery, system design, full-stack implementation, prioritization, and client-facing delivery.
- Re-architected the OAB Imperatriz scheduling platform from PHP to TypeScript/JavaScript, supporting 1,500 active users and 250+ monthly bookings across rooms and services.
- Diagnosed production authentication and data-exposure risks, strengthened access control with 2FA, integrated official attorney-registration status validation, and resolved duplicate-booking failures.

ADDITIONAL EXPERIENCE

MULTIBIKE SPECIALIZED | Operations Systems Lead & Software Engineer Jun 2019 - Present

Ribeirao Preto, SP | On-site

- Own the internal software ecosystem for service scheduling, parts control, quality workflows, sales follow-up, customer contacts, and inventory alerts across 7,500+ ERP customer records.
- Shipped the seller operations module now used for 1,500+ recorded actions, improving follow-up discipline and giving sales leadership a unified view of team activity.
- Developing an AI-assisted lead-discovery workflow that connects CRM records with public cycling-profile and equipment signals to surface network-based opportunities with restricted data exposure.

SELECTED TECHNICAL PROJECT

HARPIA | Intelligent DevSecOps Capstone 2026

University of Ribeirao Preto | Architecture and prototype

- Co-authored the architecture for a platform that orchestrates SAST, DAST, and SCA tools, then uses a Claude-based intelligent agent to correlate findings, prioritize business risk, and generate auditable remediation guidance.
- Designed webhook-driven pull-request analysis and asynchronous processing with FastAPI, Celery/Redis, PostgreSQL/pgvector, GitHub Actions, and Docker, including quality gates aligned with ISO/IEC 25010.
- Specified a secure SDLC workflow with repository onboarding, configurable scanning, analysis history, metrics, notifications, and merge-blocking criteria for critical findings.

EDUCATION & SELECTED LEARNING

UNIVERSITY OF RIBEIRAO PRETO - UNAERP | B.S. in Software Engineering Expected Dec 2026

Ribeirao Preto, SP

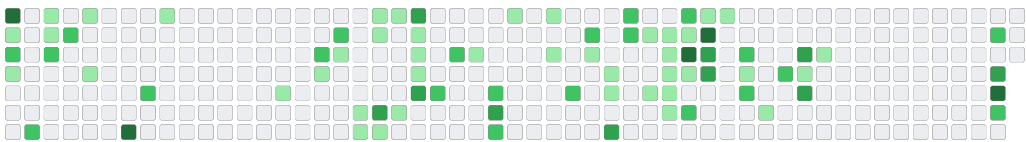

Capstone: HARPIA - Software for automation and security assessment in CI/CD pipelines assisted by an intelligent agent.

ROCKETSEAT ONE | Software Engineering Program 2026

Continuing education

Selected certifications: Aerospace Product Engineering and Rocket Physics - Brazilian Space Agency (AEB), Apr 2026.

ENGINEERING ACTIVITY

291 contributions in the last 12 months | 224 contributions Jan-Aug 2026 | Public + private repositories
